

ASV & UAV Surveys

A First Year's Experience

4D OCEAN

- Specialist ASV, UAV and AUV survey services provider
- A new company but full of experience (25 years of multibeam, 14 years of IHO hydrographic survey, 25 years of pipeline inspection)
- Specialist personnel, equipment and software
- ASVs fully equipped for hydrographic and geophysical surveys with full data processing and reporting
- UAVs for topographic, habitat mapping, precision agriculture, asset inspection and archaeology
- AUVs for when resolution matters - subsea assets, archaeology, habitat mapping

Autonomous Survey Equipment

ASV

- SeaRobotics ASV 2.5
- R2Sonic 2020 multibeam echosounder
- Applanix POS MV Wavemaster INS

UAV

- senseFly eBee Plus RTK UAV
- S.O.D.A 20 MP or Parrot Sequoia Multispectral Camera

AUV

- Kongsberg MUNIN AUV
- Kongsberg EM2040 multibeam echosounder
- Kongsberg SAS Sonar

Wembury Bay – 1st Coastal UAV Survey by 4D Ocean

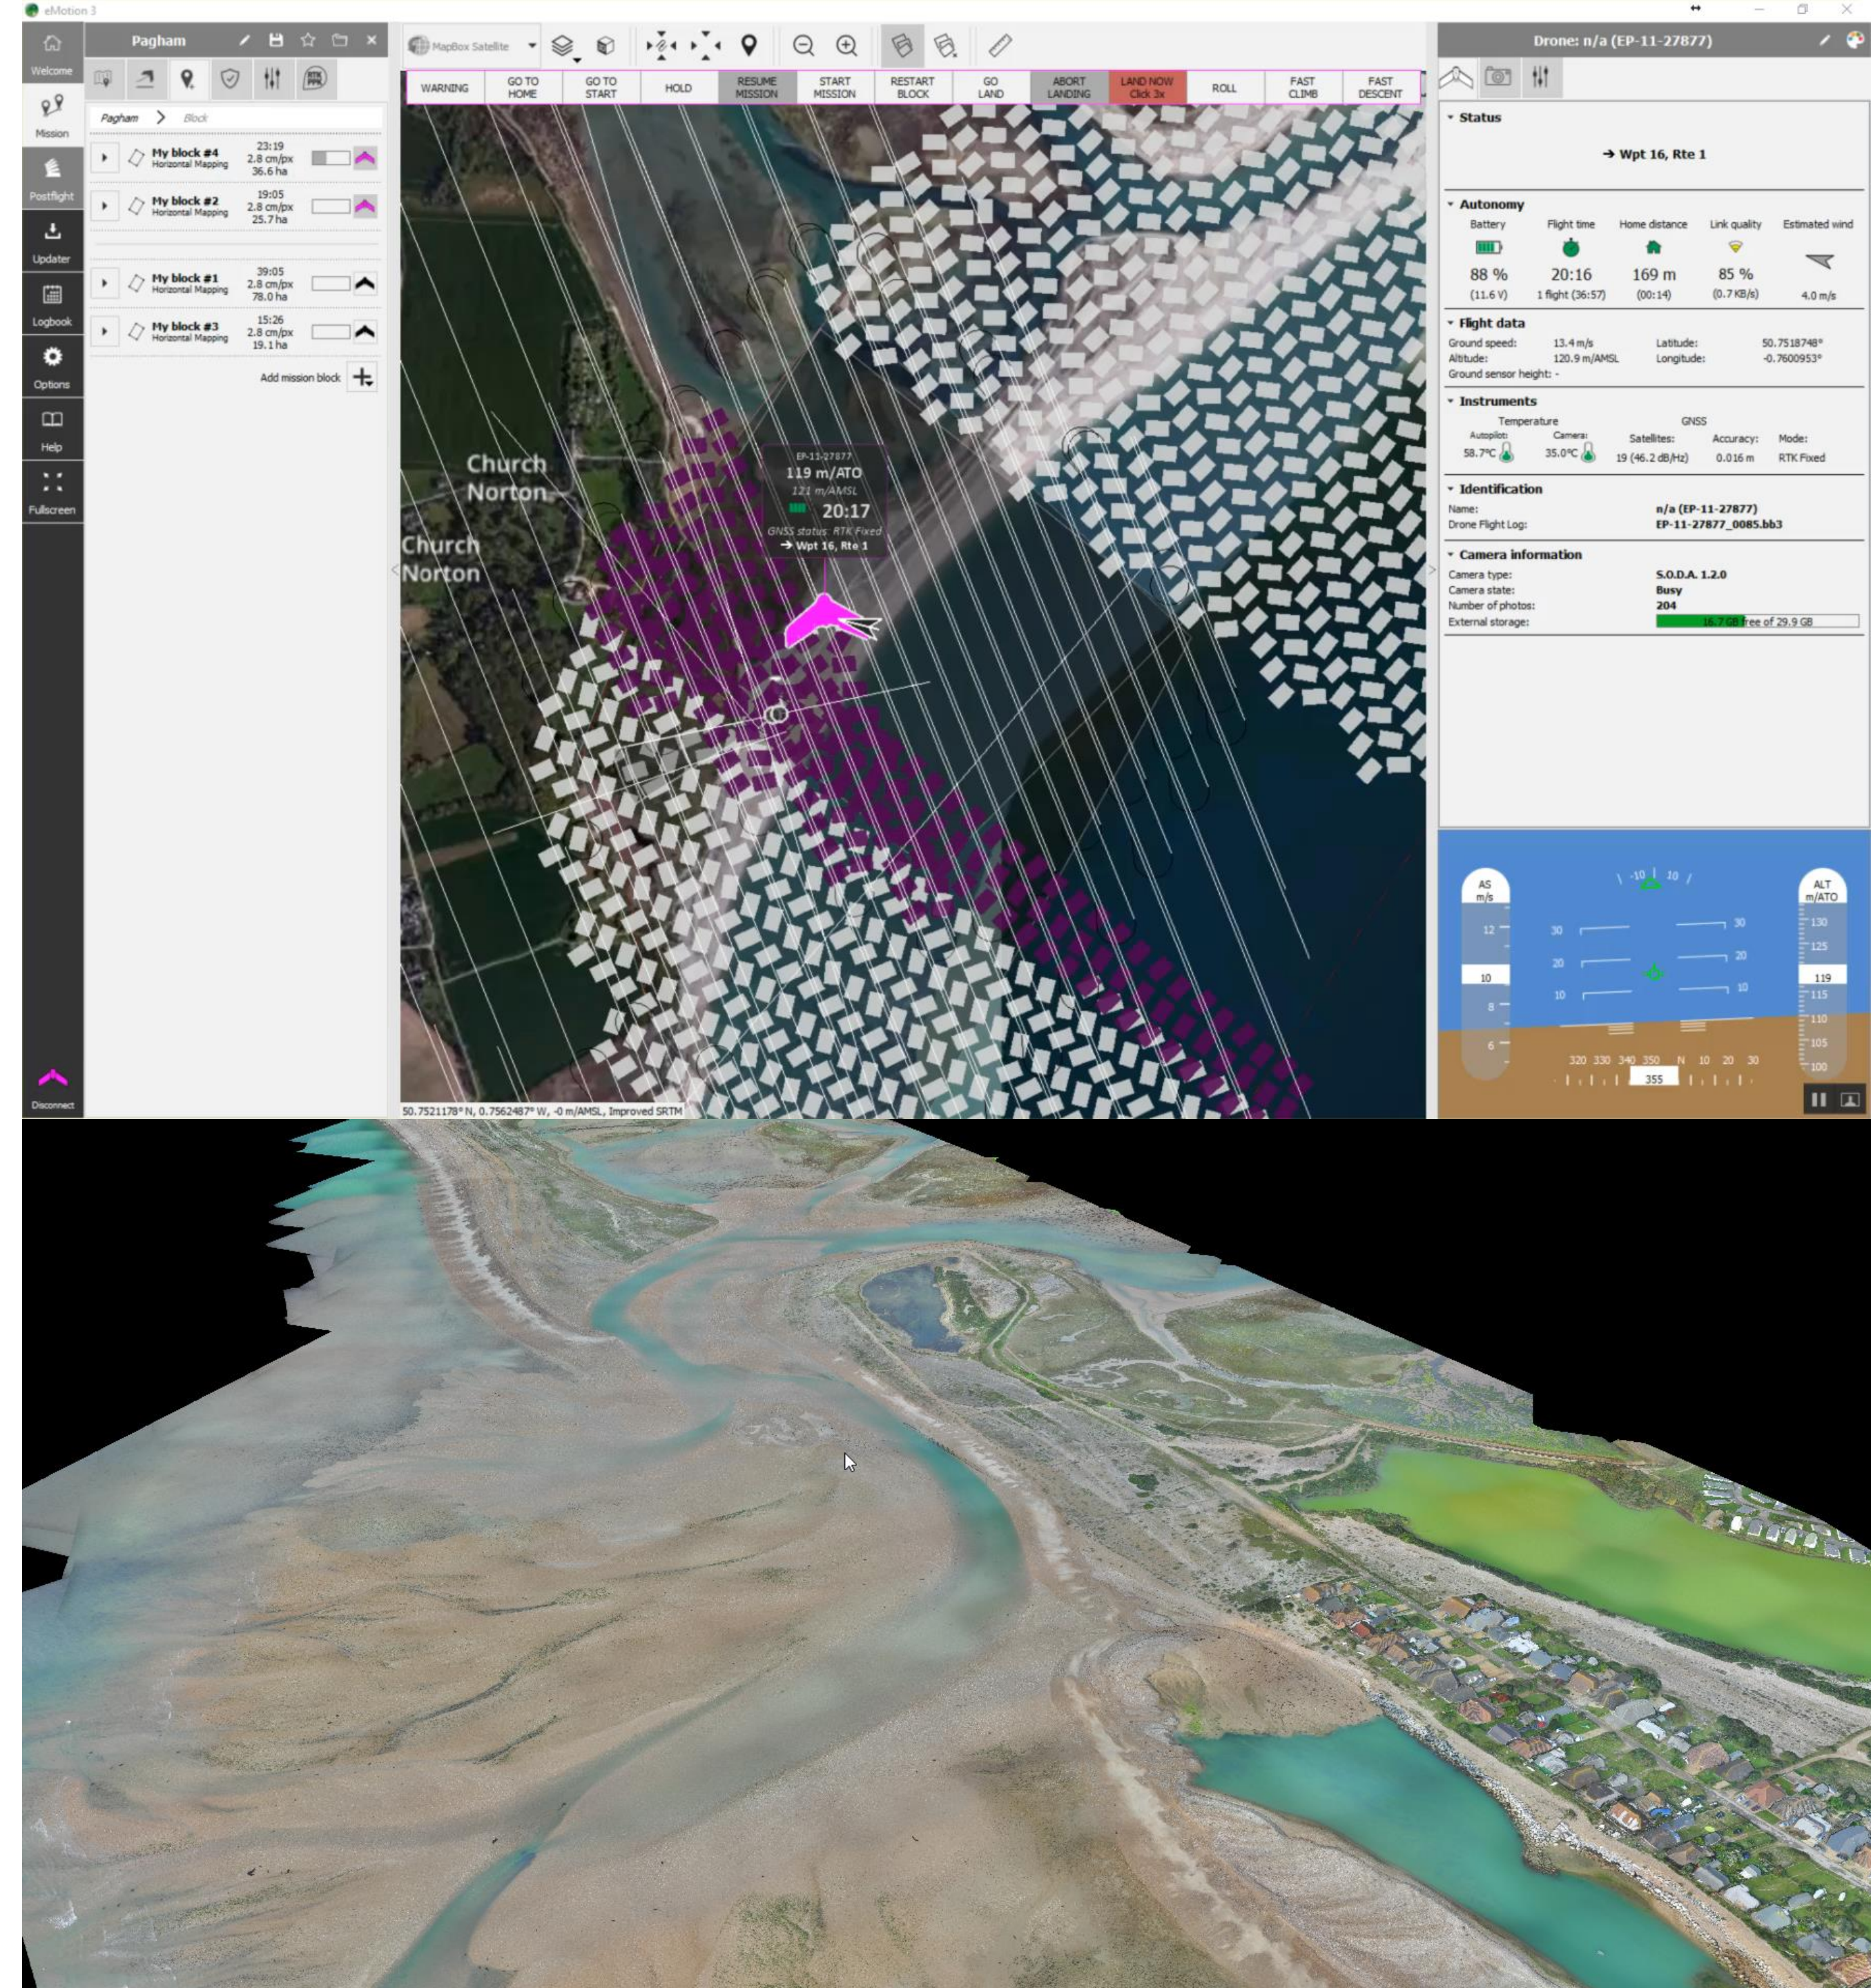

- Surveyed at low water
- No mobile phone reception meant no RTK data so GNSS had to be post processed – turned out to be very easy
- Multi-spectral camera used for one flight to collect data for further analysis to see if it can be used like Satellite Derived Bathymetry
- Two Discoveries were found
 1. Bathymetry to 1 or 2 m water depth is possible if the water is clear
 2. Surveying is cool when using drones! – My son and friend accompanied me for work experience and that was their finding.

Pagham Spit UAV Survey

- Required rapid turn-around due to river breaching the spit
- Highest resolution data and imagery
- 4 flights to fly the spit.
- 1st flight flown as soon as possible after first light to make the most of low-water in early morning.
- More batteries will be bought to enable non-stop survey operations to maximise survey efficiency at low-water.

Seaford Head UAV Survey

- Tricky area to normally access but actually quite easy to fly
- One day, four flights

Cuckmere Haven UAV Survey

- Ground Control Point information given by EA
- 6 GCPs located in the UAV point cloud

Average Difference

Easting	Northing	Height
-0.01 m	-0.01 m	0.04

- 1 flight RTK one PPK
- No further position processing

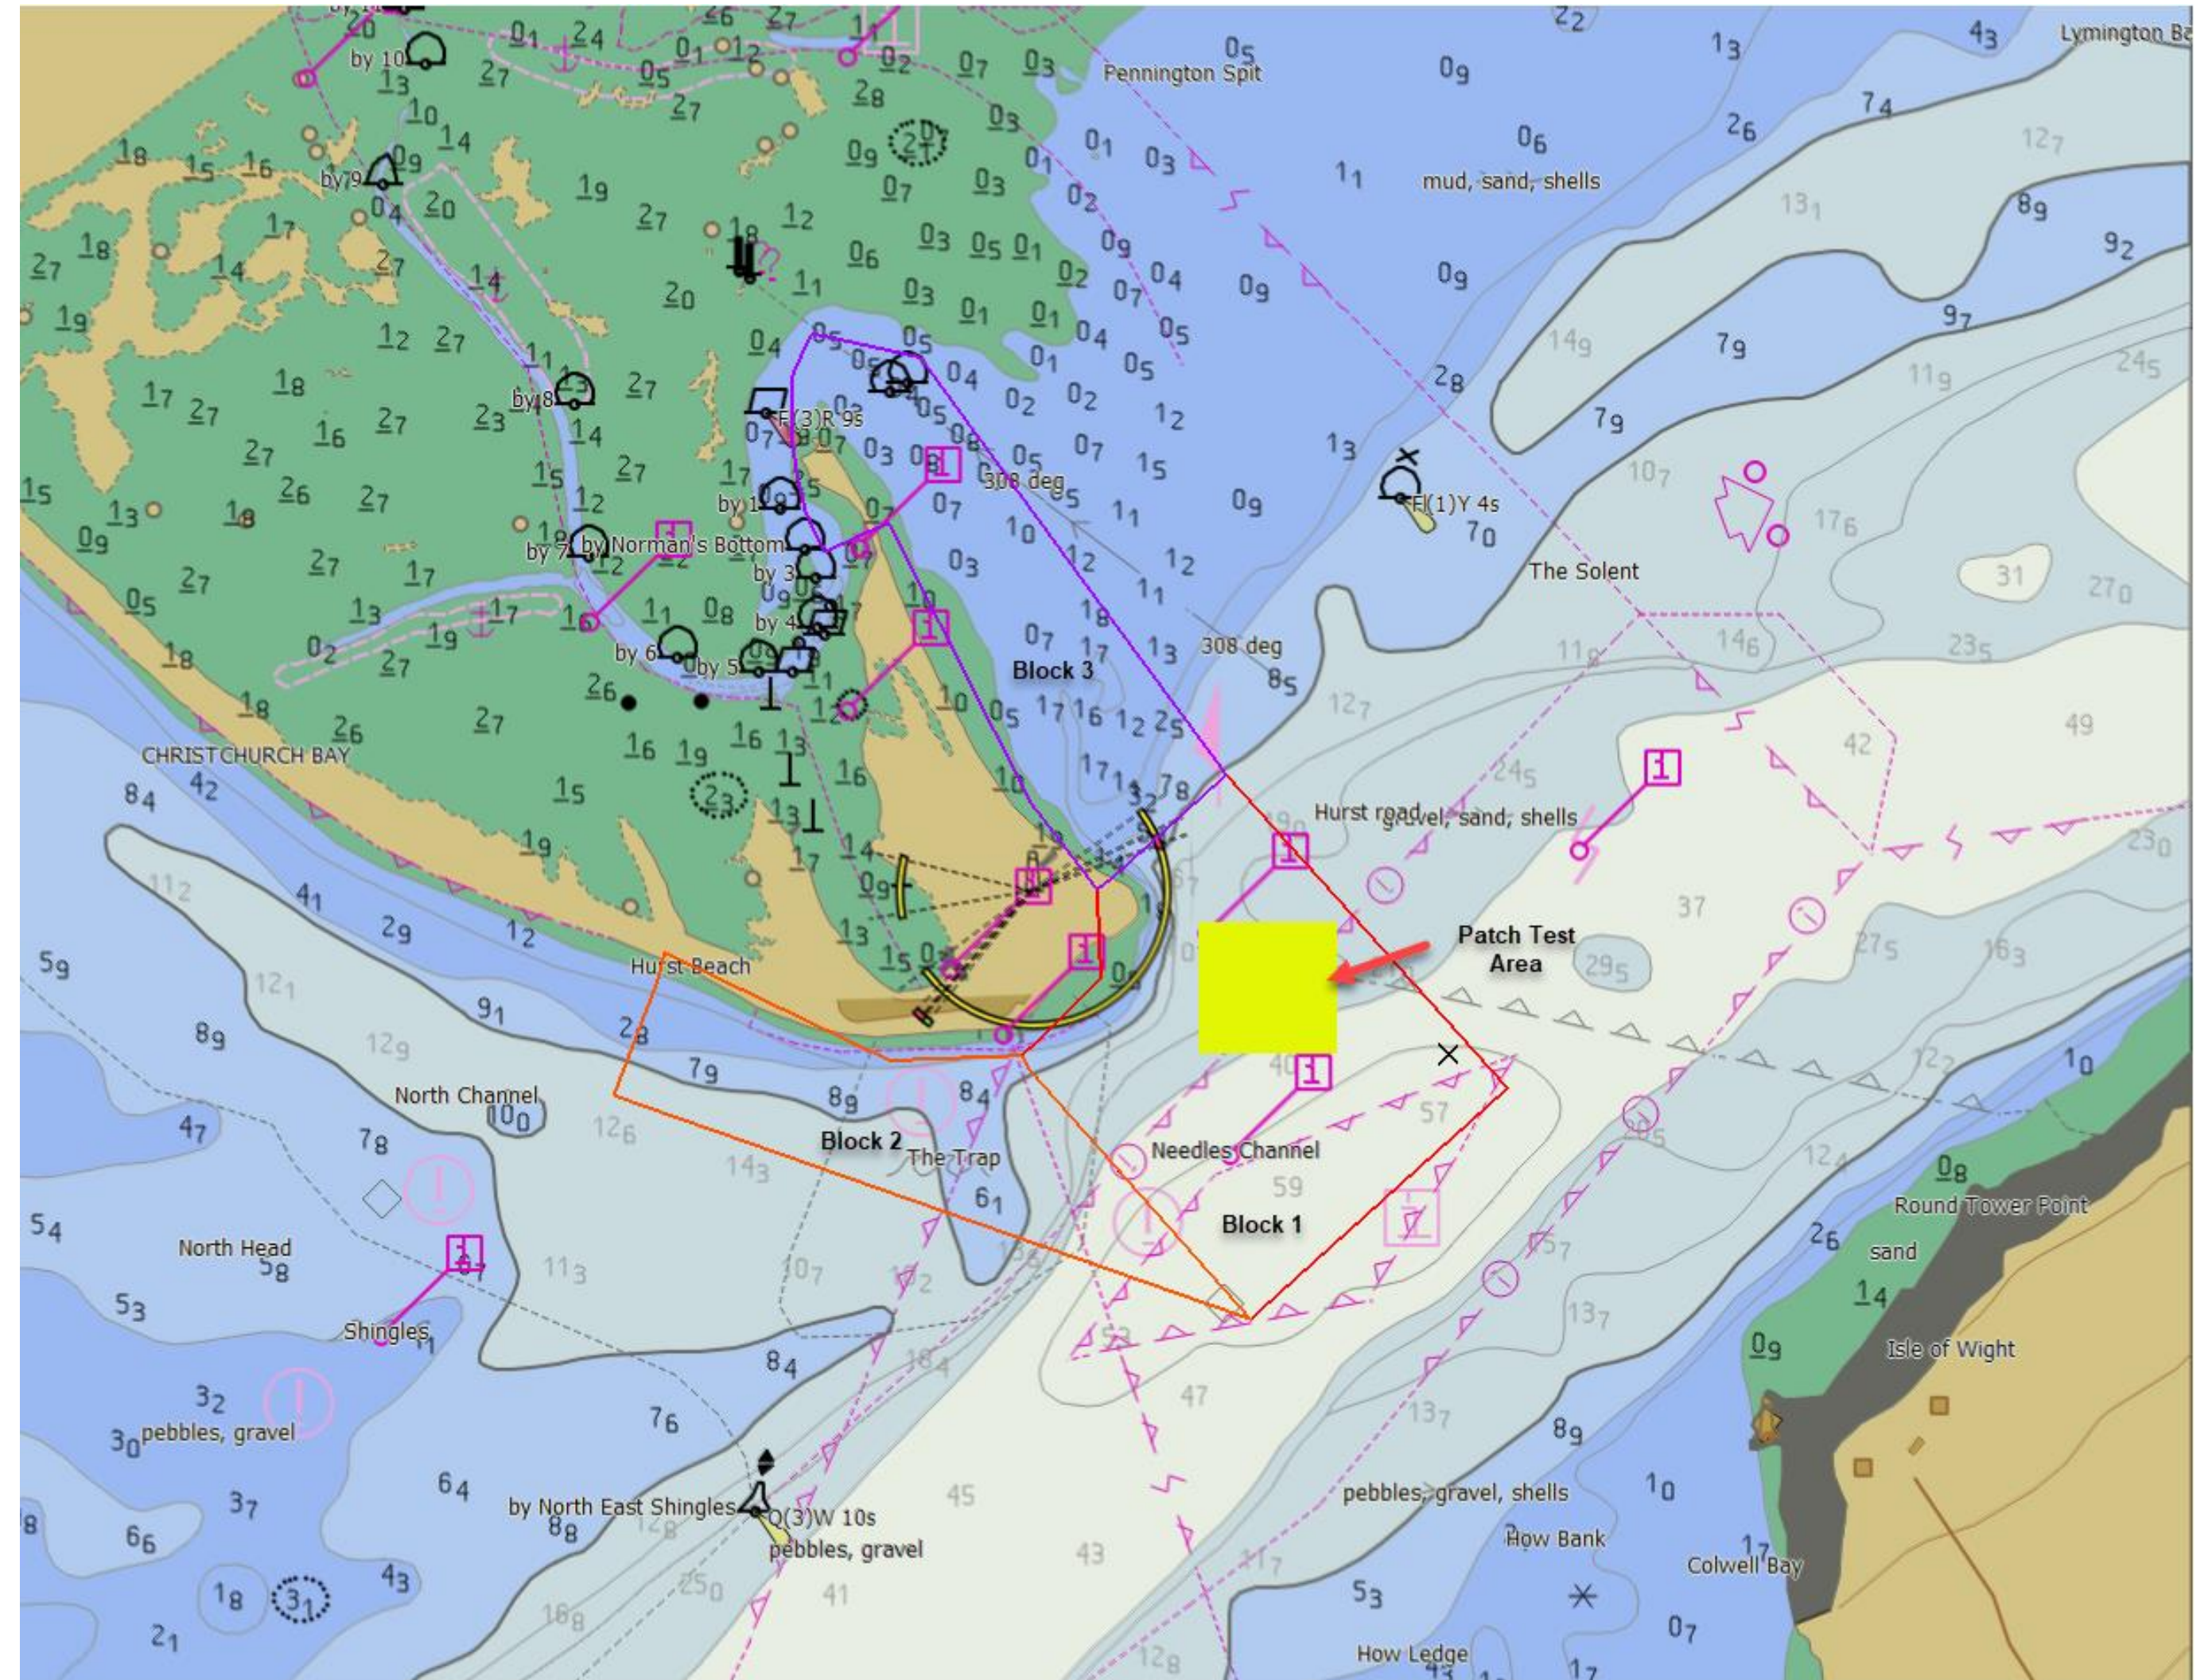

Hurst Spit ASV & UAV Survey

- IHO Order 1 Survey for Channel Coastal Observatory and the Maritime & Coastguard Agency with data validated by UKHO
- 3 Blocks: Block 1 in main channel, Block 2 along the spit and Block 3 an area without multibeam coverage.
- Block 1 lies in the western approaches to the Port of Southampton
- Mean High Water Neaps for the ASV & Mean Low Water Neaps for the UAV survey coverage
- Very dynamic current environment.
- Exposed to westerly and south-westerly winds

Hurst Spit UAV Survey

- UAV Survey conducted at Low Water Springs and before the ASV survey.
- 3 Flights to cover 80% of Hurst Spit in 3 hours of flying time.
- Multi-spectral camera also flown over salt marsh
- UAV Orthophoto mosaic used for ASV planning to show the coastal edge and any shoals to be avoided.
- Ground Control Points only required to QC UAV data as all photos already geotagged

Multi-spectral imagery: Red = water or gravel
everything else is vegetation

Is this bathy? $(\text{NIR} - \text{green}) / (\text{NIR} + \text{green})$

Hurst Spit ASV Survey

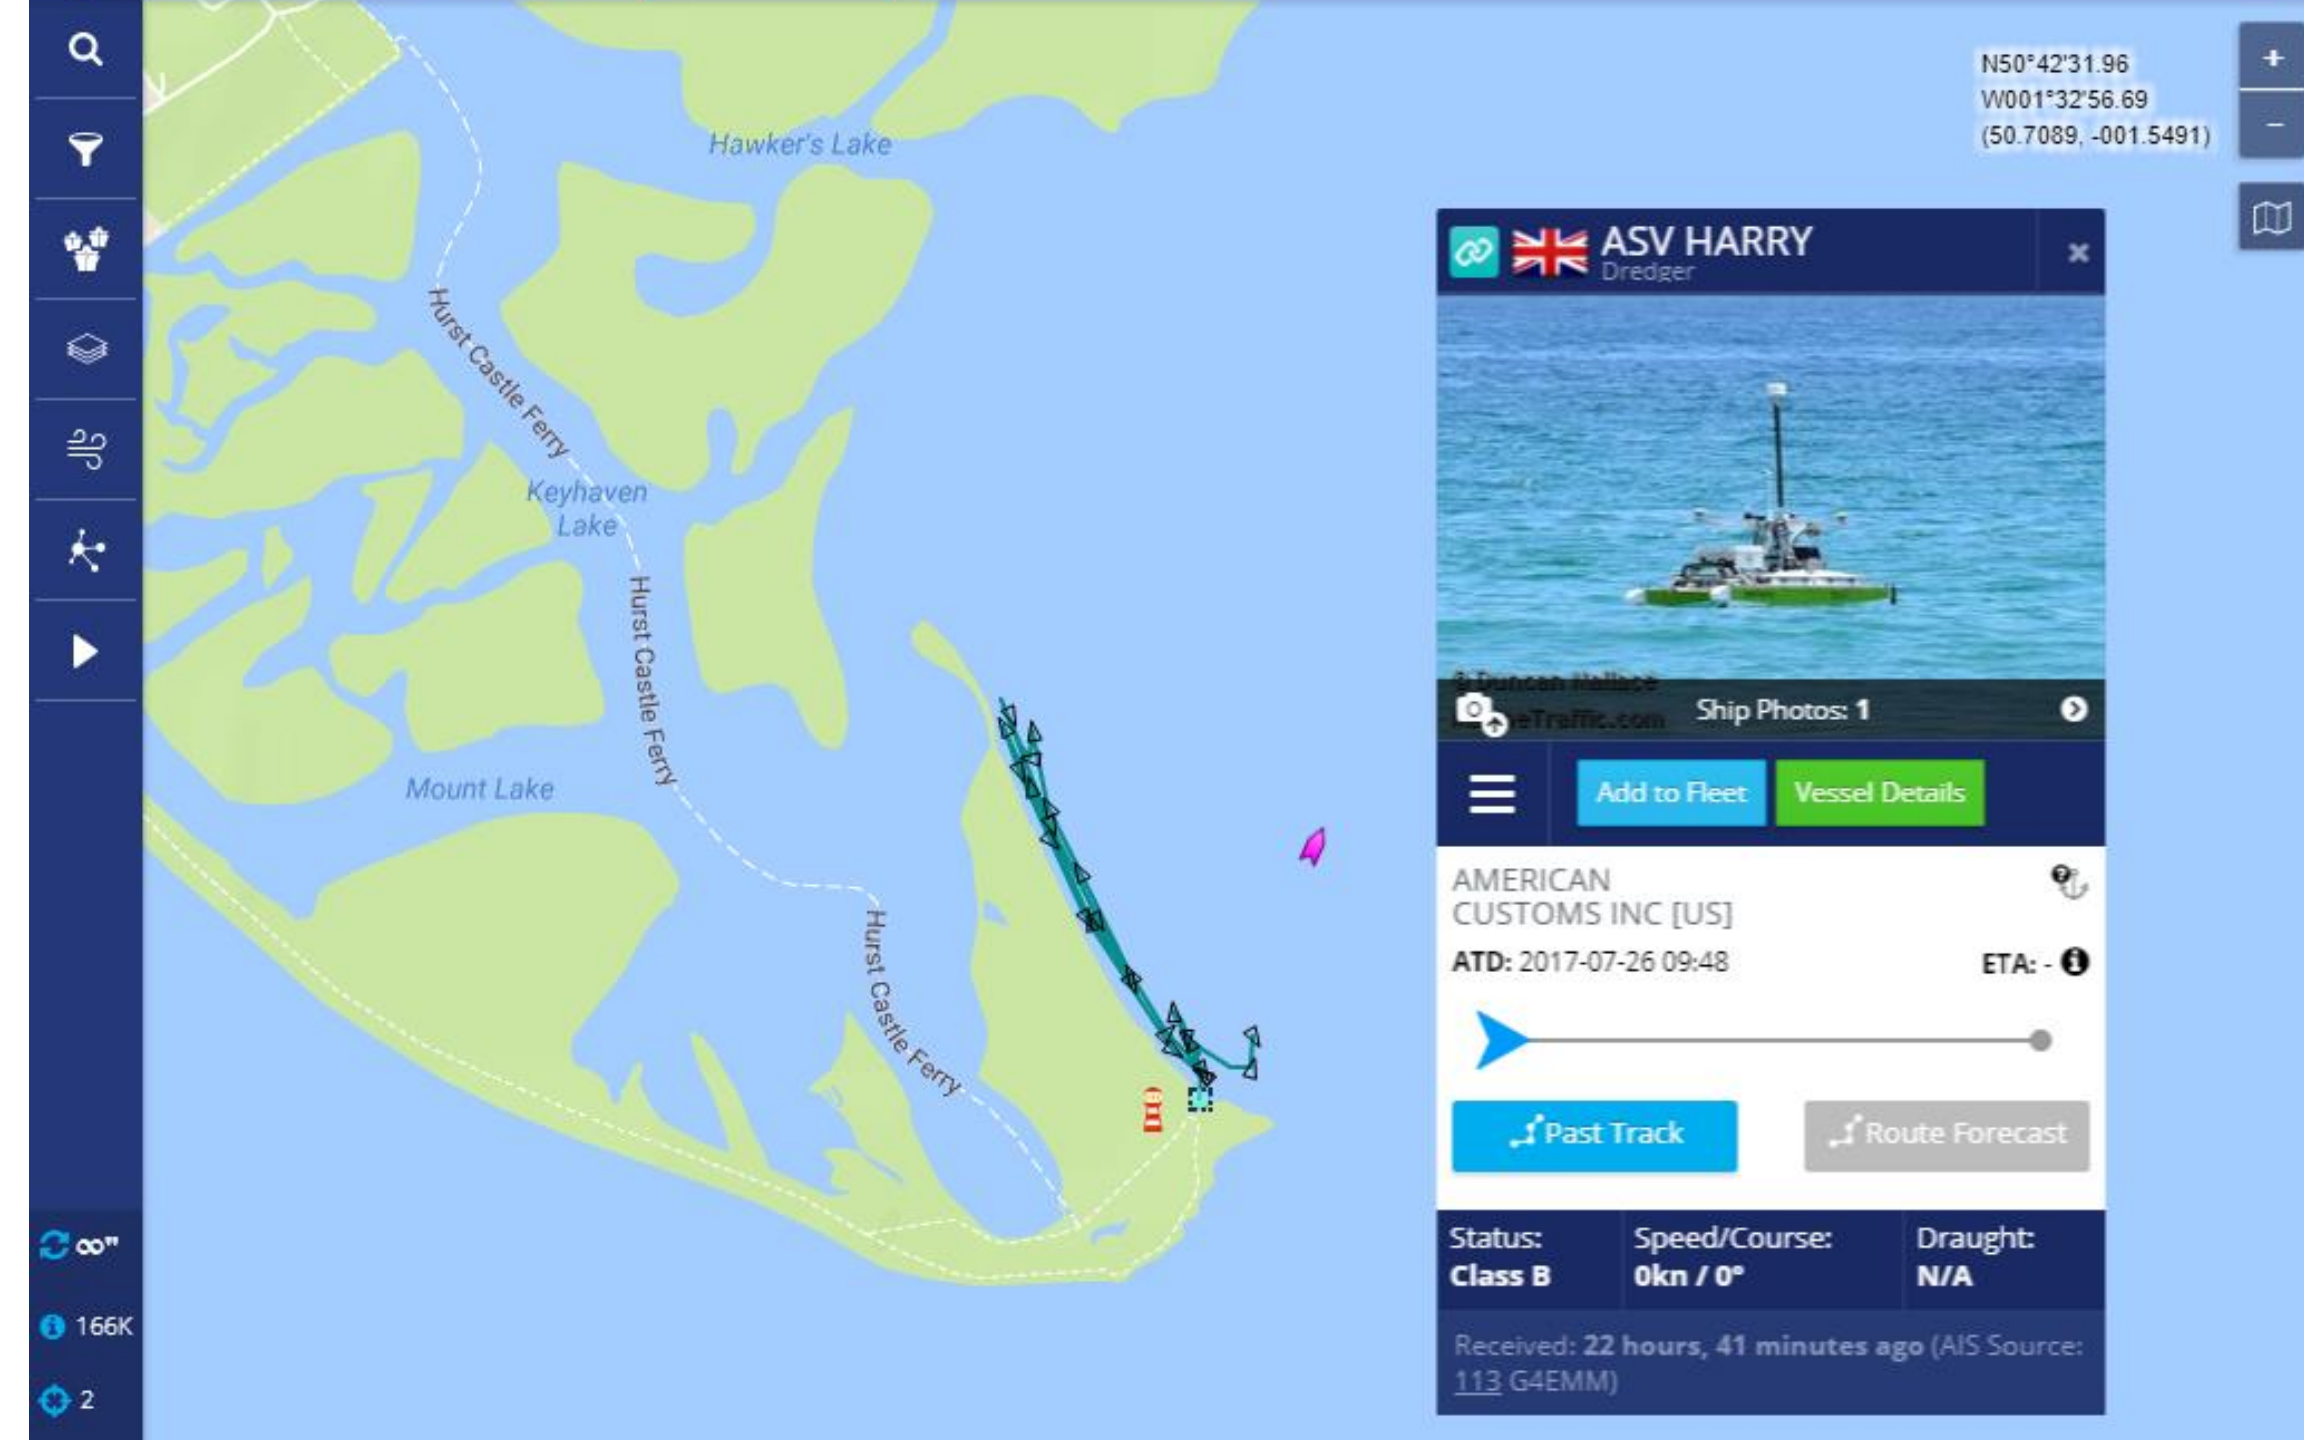

- ASV launched at site – no need to transit from a port/marina or use a slip way or require a crane.
- Surveyed at Spring Tides
- Progress could be made at up to 6 knots of current but battery life is limited at that speed.
- Normal Survey at 4 knots
- Very shallow draft of 0.4m

Hurst Spit ASV Survey

- ASV is guided by the survey software driving the autopilot and automatically giving the control software waypoints.
- Survey lines are pre-planned and automatically run or new survey lines can be generated by the sonar data.
- Hypack's "Autoline" is at an early stage but showed promise. It required a little helping hand at the beginning and end of the line
- ASV equipped with AIS, lights and a horn to alert others.

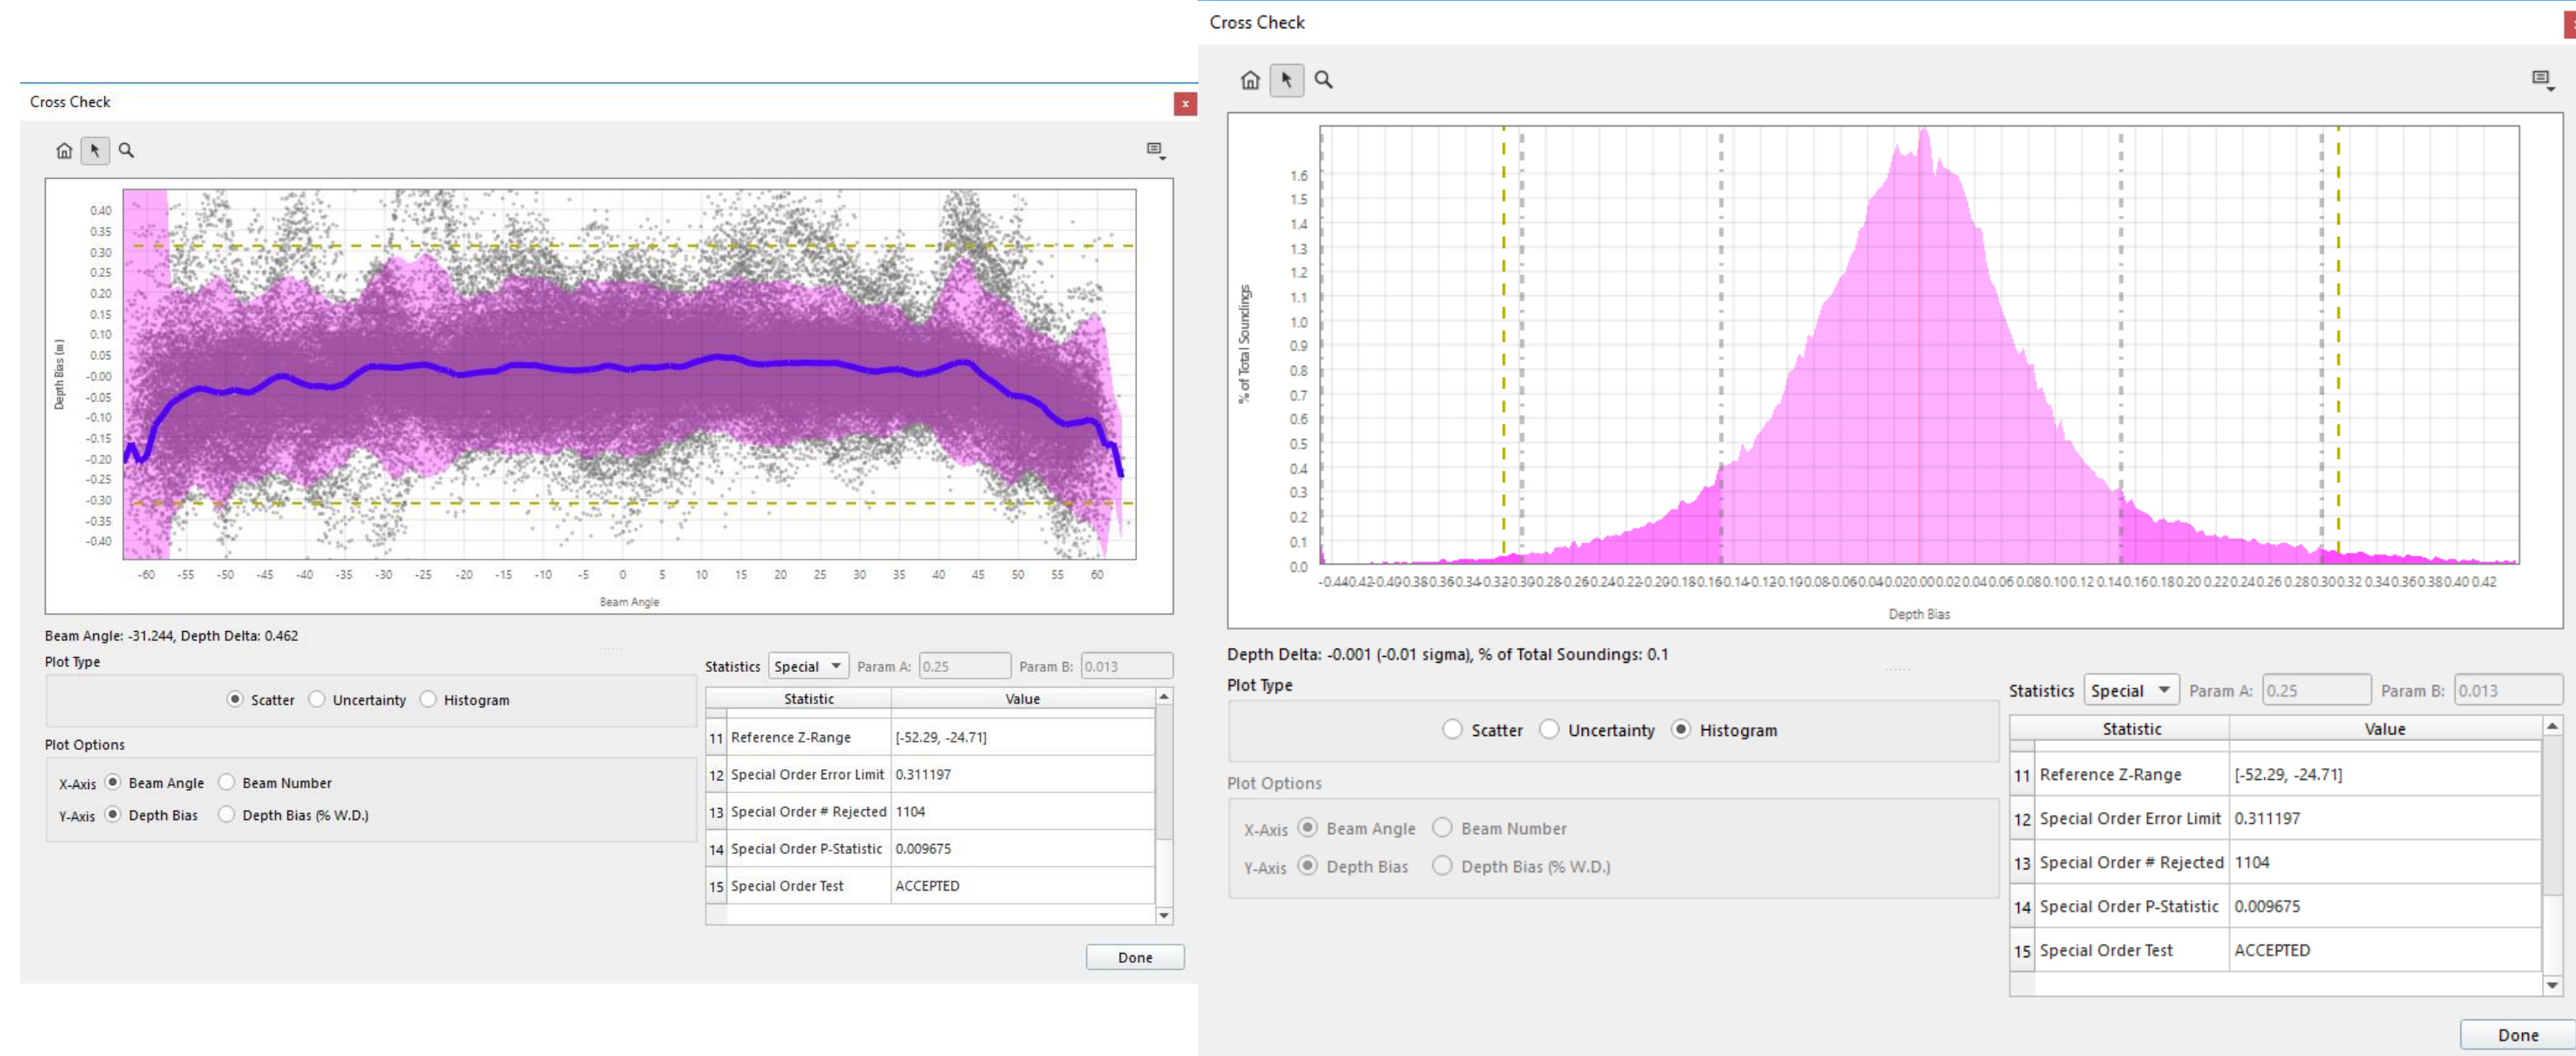

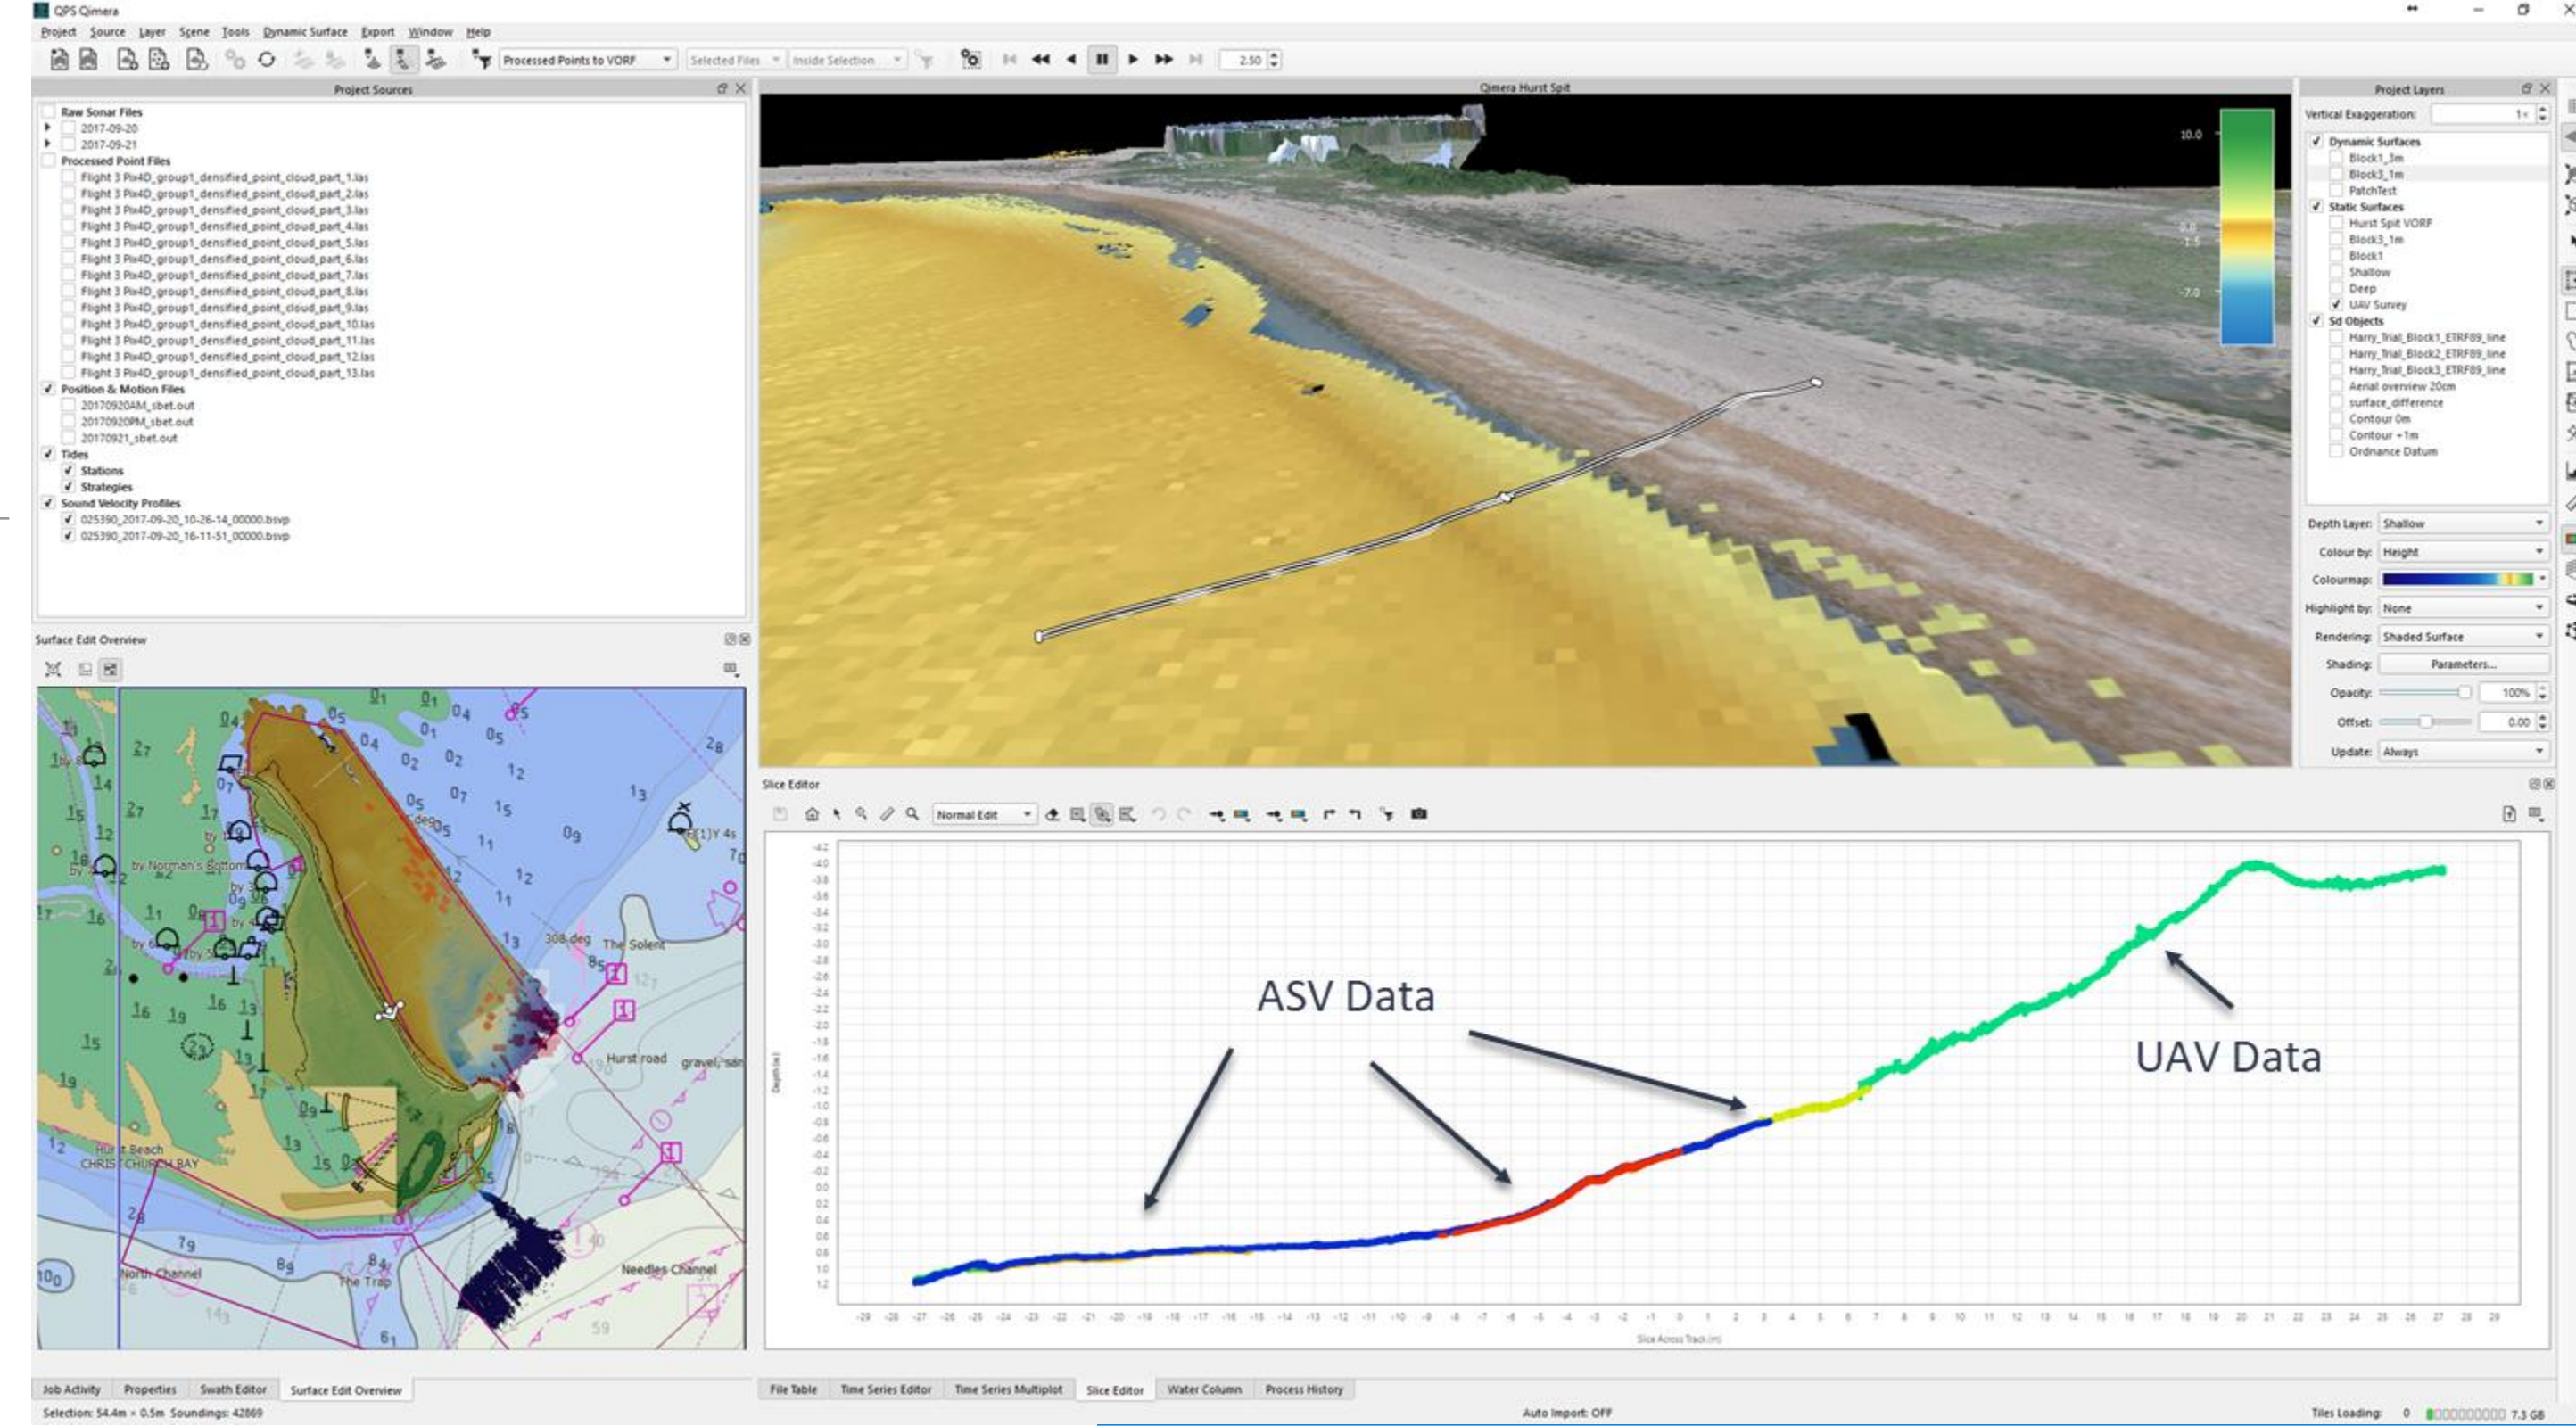

Combined ASV and UAV results

- Pix4D used for initial point cloud creation of UAV data and multi-spectral processing
- QPS Qimera used for all point cloud processing
- Raw sonar data combined with LAS files from the UAV survey to create one seamless model to clean
- The two sets of data matched to within 10 cm
- The ASV survey met IHO Special Order Accuracy

Lessons Learnt

- Tidal currents play a big part in the planning of the survey both in terms of time to survey and endurance of the ASV.
- Autonomous operation is better when the ASV is tracking a line rather than heading towards a start point, especially in high current environments.
- Having a run-in line before the start would ensure line keeping at the beginning would be improved.
- A simple remote control device for launch and recovery would make it easier and would not require shutting down of communication with the ASV.
- AIS is essential as are lights on the ASV as in low light conditions it is quite hard to see the ASV as it is low to the water.
- Screen real-estate is limited so another computer running processing software updated in near real-time will help ensure data quality control

Project Sources

Future Developments – Only happens with Partnerships

- QPS QINSy Autopilot driver includes turn lines and run-in – *completed* - already integrated into SeaRobotics OIS software
- Safe route back to recovery location – keeps line updated in memory and safe path over seabed already surveyed
- Automatic line creation based on sonar coverage that extends/clips to survey area polygon – this will make survey operations totally autonomous
- Include SVP casts in online software control
- Intelligent warnings when data issues occur
- Collision avoidance
